Published GFS–GLM panel

GBP5 Shared	Supports host defense and inflammatory signals	Human and mouse experiments
BNIP3L	Helps developing red blood cells remove mitochondria	NIX protein; mouse studies
KLF6	Controls inflammatory genes in macrophages	Human and mouse cells
DYSF	Helps membrane repair and monocyte attachment	Human cells and deficiency studies
LASP1	Links cell structure to movement	Cell experiments; context matters
PCBP1	Binds RNA and delivers iron to storage proteins	Biochemical, yeast and human-cell evidence

GFS–XGBoost panel

GBP5 Shared	Supports host defense and inflammatory signals	Human and mouse experiments
AHNAK	Organizes calcium signals in immune T cells	Main supporting experiment: mouse T cells
JMJD1C	Regulates development of platelet-producing cells	Cell models; effects depend on the model
MNDA	Helps monocytes amplify interferon signals	Human-cell experiments; IRF7 regulation
LYZ	Breaks bonds in bacterial cell walls	Lysozyme enzyme; RNA often marks myeloid cells
SPI1	Controls gene programs for blood-cell development	PU.1 protein; includes myeloid cells

Experimental functions explain possible biology. They do not prove pathway activity or TB specificity in plasma.
